

Single-Stage Instance Shadow Detection with Bidirectional Relation Learning

Tianyu Wang*, Xiaowei Hu*, Chi-Wing Fu, and Pheng-Ann Heng

Introduction

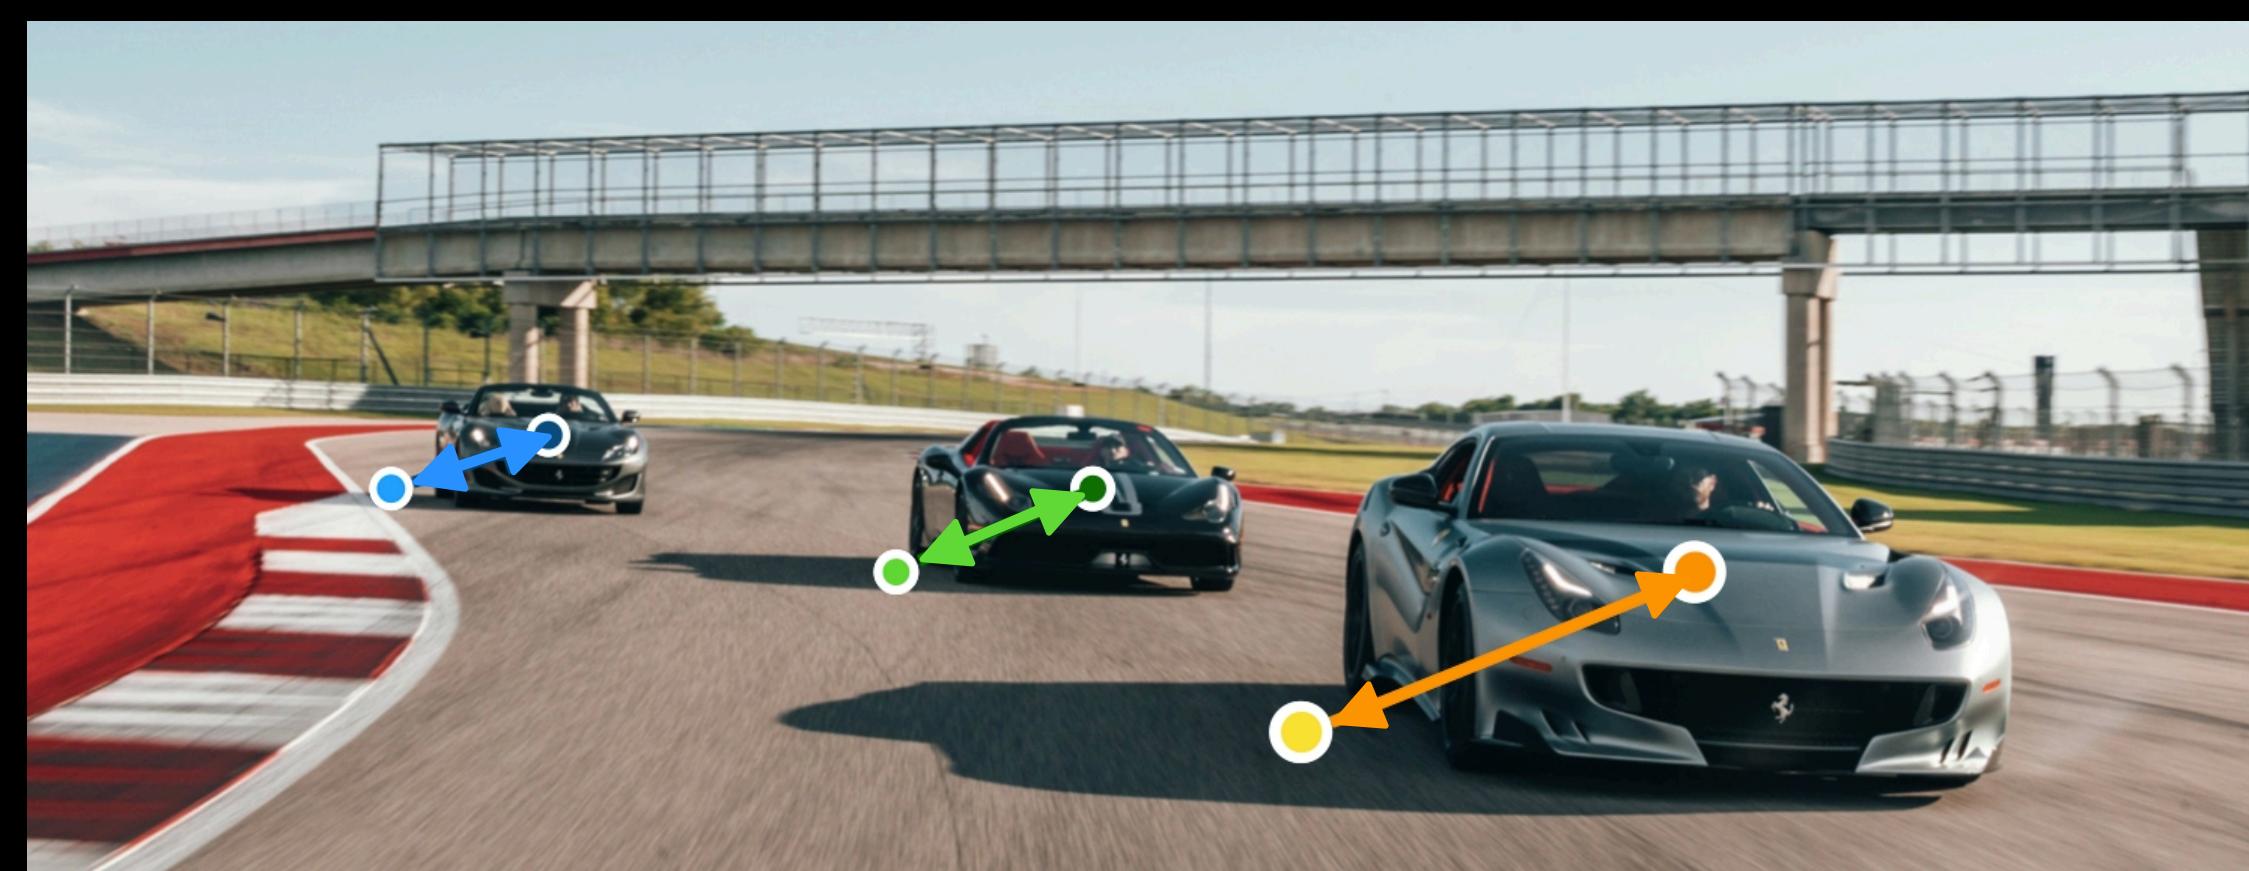

Instance Shadow Detection aims to find shadow instances, object instances and shadow-object associations; this task benefits many vision applications, such as light direction estimation and photo editing.

In this paper, we present a new single-stage fully convolutional network architecture with a bidirectional relation learning module to directly learn the relations of shadow and object instances in an end-to-end manner. The experimental results demonstrate that our method outperforms the state-of-the-art method with an improvement of over 29% in accuracy.

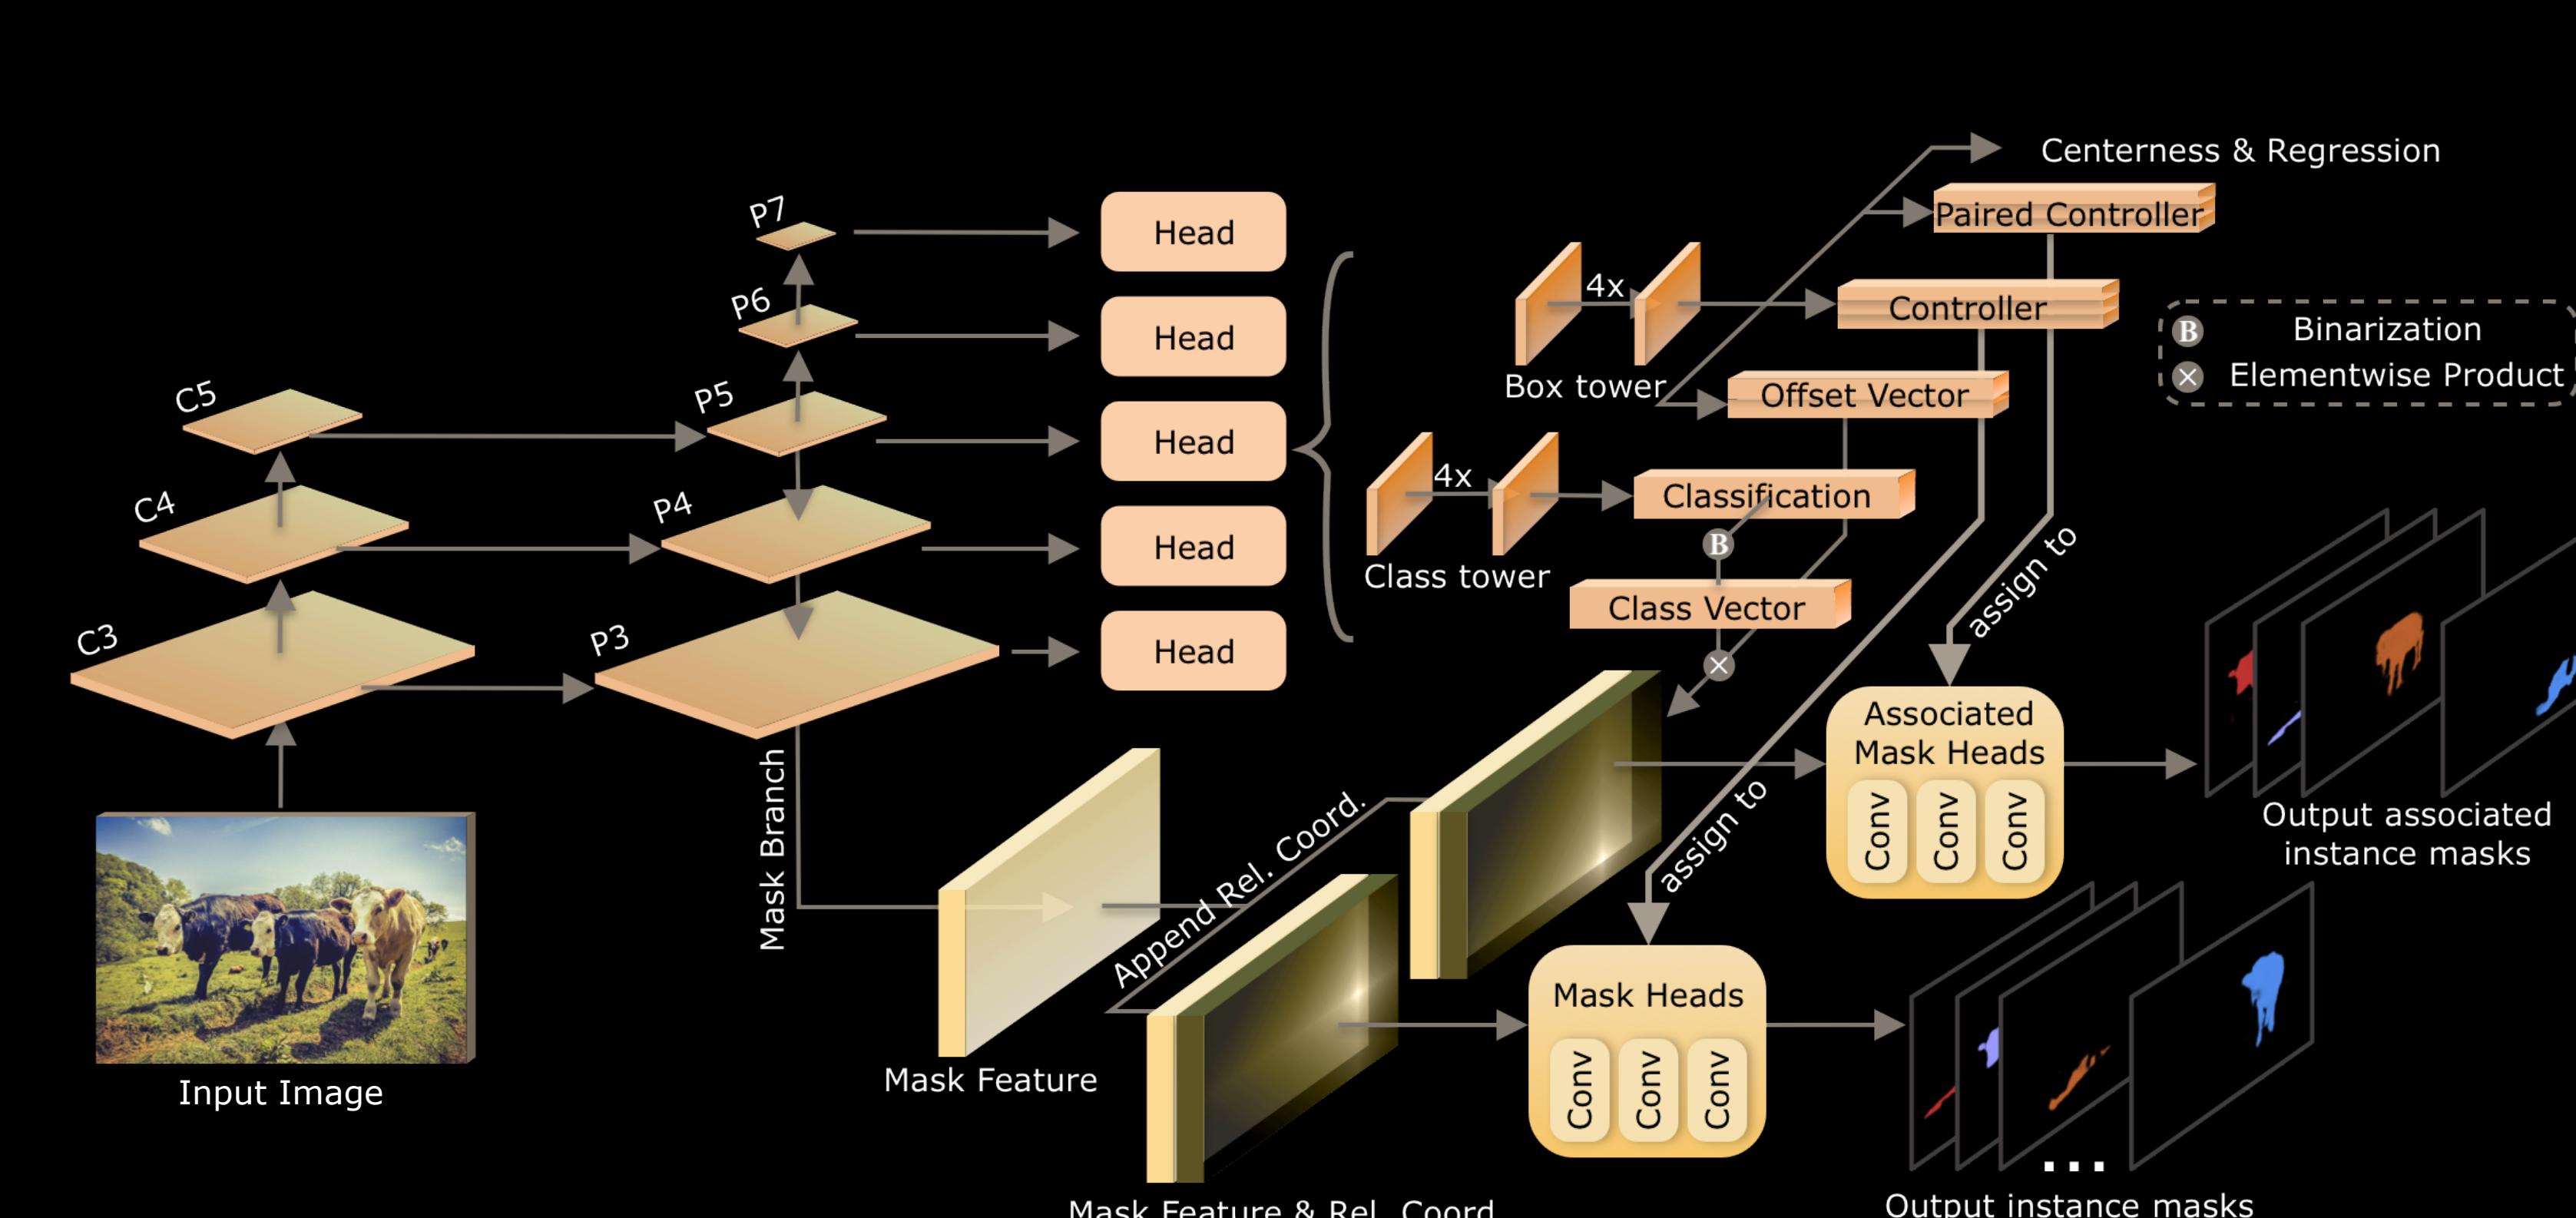

Motivation

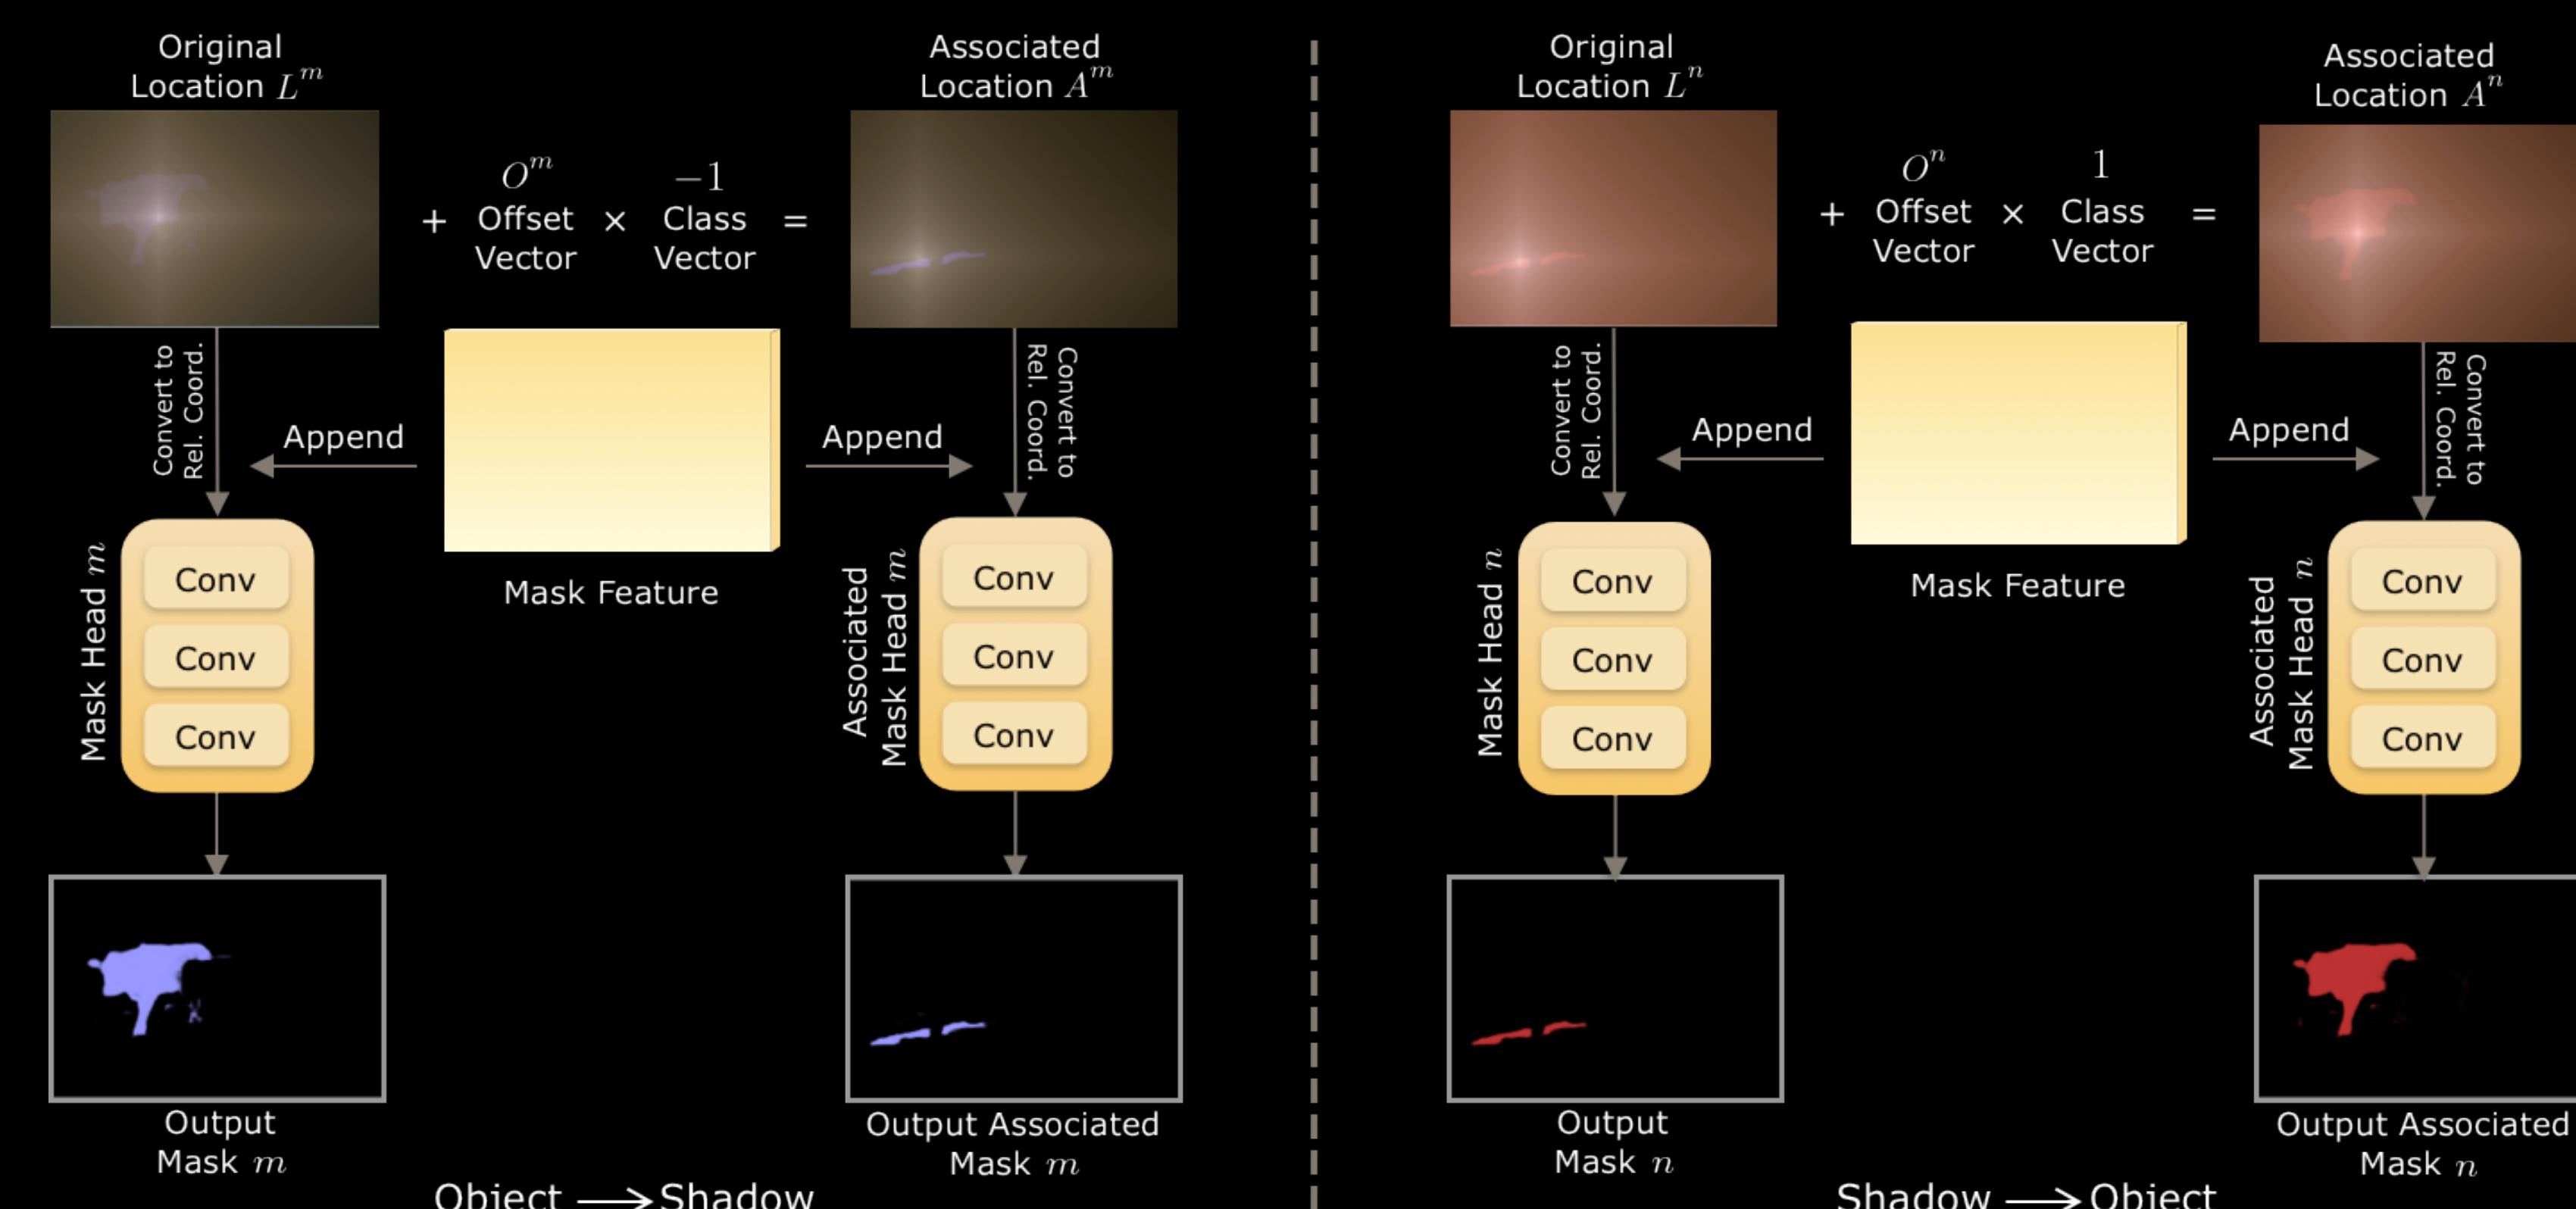

We explore the inherent correlation directly between the shadow and object instances, and present to learn the offset vector from the center of each shadow instance to the center of the associated object instance, as well as the other way around.
